

MARIZFIRST

Simple Project Idea Document

Healthcare Appointment Discovery + Assisted Booking Platform

Item	Final Direction
Product type	Patient-first healthcare discovery and appointment assistance platform
Core users	Patients, doctors, hospitals, clinics, MarizFirst admin team
Main conversion	Appointment request + WhatsApp confirmation
MVP model	Hybrid booking: user selects slot, appointment stays Pending Confirmation until admin/partner approval
Trust strategy	Verified profiles, transparent details, clear appointment status, privacy-first patient data handling
Business model	Partner listing plans, appointment commission, featured listings, future patient services

1. Exact Project Idea

MarizFirst is a healthcare appointment marketplace where patients can discover verified doctors, hospitals and clinics, check profile details, choose a preferred appointment slot, and submit a booking request. The platform does not behave like a simple directory. It works like an assisted booking system where MarizFirst or the healthcare partner confirms the appointment before the patient visits.

The strongest simple idea is:

“Find trusted doctors, hospitals and clinics near you, choose a suitable slot, and get appointment support through MarizFirst.”

2. Problem MarizFirst Solves

Audience	Problem	MarizFirst Solution
Patient	Hard to find trusted care quickly and confirm appointments reliably.	Verified listings, search filters, short booking form and WhatsApp support.
Doctor	Needs quality appointment requests without managing a complex tech system.	Profile page, visibility, slot management and controlled booking requests.
Hospital	Needs patient acquisition across departments and locations.	Hospital profile, linked doctors, facilities, location pages and lead capture.
Clinic	Needs local appointment demand and simple digital discovery.	Clinic profile, appointment request flow and partner dashboard.
Admin team	Needs control over listings, leads and confirmation quality.	Internal dashboard for appointments, partners, content, SEO and operations.

3. Product Positioning

MarizFirst should be positioned as a trusted healthcare appointment assistance platform, not as a coupon or discount website. The brand promise should focus on reliability, verified partners, quick discovery and guided confirmation.

- Primary promise: trusted healthcare discovery with assisted appointment confirmation.
- Tone: clean, reliable, patient-first and professional.
- Avoid: discount-led messaging, fake urgency, fake reviews, guaranteed treatment claims or medical advice promises.
- Best launch focus: one strong local market first, then expand city-wise and speciality-wise.

4. MVP Scope

Module	MVP Requirement	Priority
Public website	Home, doctors, hospitals, clinics, specialities, cities, blog and legal pages.	P0
Doctor profiles	Fees, qualification, experience, registration number, location, slots, CTA, FAQ and SEO schema.	P0
Hospital/clinic profiles	Facilities, specialities, doctors, address, gallery and enquiry/booking CTA.	P0
Booking system	Slot selection, patient form, consent, appointment status and admin/partner verification.	P0
Admin panel	Manage listings, appointments, leads, SEO, blogs, partners and revenue fields.	P0
Partner dashboard	Profile update, slot management and appointment accept/reject/reschedule actions.	P0
Notifications	WhatsApp acknowledgement, confirmation, reschedule, cancellation and reminder messages.	P0
SEO foundation	Dynamic metadata, sitemap, robots, schema and city/speciality landing pages.	P0

5. What Not to Build in Phase 1

- Full EMR/EHR system.
- Mobile app before the web funnel is proven.
- Teleconsultation or video consultation unless partner operations are ready.
- Online payment until partner settlement workflow is clearly defined.
- Public reviews/ratings unless they are linked to verified completed appointments.
- AI medical diagnosis, treatment advice or emergency-care claims.

6. Recommended Booking Workflow

1. Patient searches by doctor, speciality, clinic, hospital, city or location.
2. Patient opens a verified profile page and reviews details.
3. Patient selects a visible preferred slot.
4. Patient submits name, phone, city, concern and consent.
5. System creates the appointment as Pending Confirmation.
6. Admin and partner receive the appointment request.
7. Partner or admin confirms, reschedules or cancels the request.
8. Patient receives final WhatsApp update with confirmed appointment details.

This hybrid model is safer than fake real-time confirmation because healthcare partners often change availability manually. Trust will break quickly if the website confirms slots that are not actually available.

7. Main Website Pages

Page	URL Pattern	Purpose
Home	/	Primary search and conversion page.
Doctors listing	/doctors	Doctor discovery with filters.
Doctors by city	/doctors/[city]	Local SEO and city discovery.
Speciality + city	/doctors/[speciality]/[city]	High-intent SEO landing page.
Doctor profile	/doctor/[doctor-slug]	Main appointment conversion page.
Hospitals	/hospitals and /hospital/[slug]	Hospital discovery and lead capture.
Clinics	/clinics and /clinic/[slug]	Clinic discovery and booking request.
Specialities	/specialities/[slug]	Education plus relevant doctors.
Blog	/blog/[slug]	SEO, trust and patient education.
Partner page	/partner-with-us	Doctor, hospital and clinic onboarding.
Legal pages	/privacy-policy, /terms, /medical-disclaimer	Trust, compliance and risk control.

8. UX/UI Direction

The design should be premium healthcare, not luxury real estate. Healthcare users need clarity, trust, readable information and fast actions. Use white surfaces, deep navy text, teal/blue accents, soft green success states, high contrast and mobile-first cards.

- Mobile-first search and booking flow.
- Sticky profile CTA on mobile: Book Appointment and WhatsApp Support.
- Short form only: name, mobile, city, preferred slot, optional concern and consent.
- Clear appointment status: Pending Confirmation, Confirmed, Rescheduled, Cancelled.
- Accessible inputs, visible focus states, keyboard-friendly forms and readable 16px+ body text.

9. Recommended Technology Stack

Layer	Recommendation	Reason
Frontend	Next.js App Router + TypeScript	SEO-friendly, scalable routing and server components.
Styling	Tailwind CSS + design tokens	Fast responsive UI and consistent design system.
Forms	React Hook Form + Zod	Validation, error handling and maintainability.
Database	PostgreSQL	Reliable relational data for healthcare listings, slots and appointments.
ORM	Prisma	Typed queries, migrations and clean schema management.
Admin/CMS	Payload CMS or custom RBAC admin	Manage content, listings, users and appointments.
Notifications	Official WhatsApp Business API	Reliable appointment communication.
Monitoring	Sentry + structured logs	Error tracking and production debugging.
Hosting	Vercel + managed PostgreSQL	Fast deployment and scalable MVP infrastructure.

10. Database Entities Required

- User and role management: super admin, admin, content editor, doctor partner, hospital partner, clinic partner.
- Doctor, hospital, clinic, speciality, city and location models.
- Appointment slot, appointment, patient and lead records.
- Notification logs for WhatsApp/email updates.
- Commission/listing plan records for monetization.
- Blog posts, FAQs, SEO metadata and redirects.
- Audit logs for critical admin and partner actions.

11. Revenue Model

Revenue Stream	How It Works
Appointment commission	MarizFirst earns a commission for confirmed/completed appointment leads.
Monthly listing fee	Doctors, clinics or hospitals pay for verified visibility and profile management.
Featured listings	Partners pay for premium placement in search, city or speciality pages.
Partner packages	Hospitals and clinics pay for bundled onboarding, content, SEO and lead management.
Future patient services	Possible future expansion into diagnostics, health packages or care navigation.

12. Security, Privacy and Compliance

- Protect patient phone numbers, concerns and appointment data as sensitive internal information.
- Use role-based access control and partner ownership checks on every dashboard API.
- Use HTTPS, secure cookies, rate limiting, CAPTCHA/Turnstile and audit logs.
- Never expose patient data publicly or allow partners to access unrelated leads.
- Mandatory legal pages: Privacy Policy, Terms, Medical Disclaimer, Partner Terms and Data Deletion process.
- Medical disclaimer: MarizFirst is appointment assistance and healthcare discovery; it is not emergency care, diagnosis or treatment guarantee.

13. Launch Plan

Phase	Focus	Output
Phase 1: Product Foundation	Scope, roles, user flows, sitemap, UX wireframes and design system.	Clear MVP plan and approved UI direction.
Phase 2: Core Development	Next.js setup, database schema, public pages, profiles, booking form and admin basics.	Working public website and appointment request flow.
Phase 3: Operations Tools	Partner dashboard, slot logic, appointment status actions, notifications and audit logs.	Operational booking system.
Phase 4: SEO + QA	Metadata, schema, sitemap, performance, security, responsive QA and launch data.	Production-ready MVP.
Phase 5: Launch	Domain, SSL, analytics, Search Console, backups and first-week monitoring.	Live MarizFirst MVP.

14. Final Product Statement

MarizFirst should launch as a trusted healthcare appointment assistance platform for verified doctors, hospitals and clinics. The MVP should focus on strong search, high-quality profiles, slot-based appointment requests, admin/partner confirmation, WhatsApp updates, SEO landing pages and secure patient data handling. The goal is not to build a large healthcare super-app on day one. The goal is to prove a reliable local appointment funnel, build partner trust, and scale city by city with clean operations.
